“Métodos de prevención, escalables y a bajo costo para la contención del SARS-CoV-2 en comunidades de bajos ingresos en Quezon City y Lagonoy, (República de Filipinas)”

what is coronavirus?

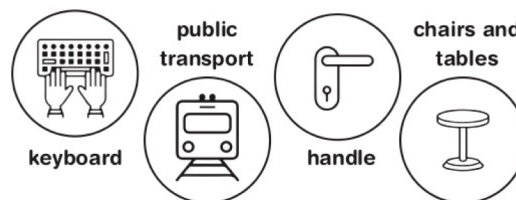

Coronaviruses are a group of related RNA viruses that cause diseases in humans and other animals. In humans, they cause respiratory tract infections that can range from mild to lethal. SARS-CoV-2, the recently discovered (2019) coronavirus, has generated a global pandemic causing the pneumonia known as COVID-19.

An image made available by the National Institutes of Health shows a transmission electron micrograph of a high virus accumulation in a sample of adipose tissue from a patient.

where can we find coronavirus?

We can find coronavirus close to the objects that has been previously in contact with sick people.

be careful, you cant' see it but you can feel it

SARS-CoV-2, the recently discovered (2019) coronavirus, has generated a global pandemic causing the pneumonia known as COVID-19.

incubation period

The incubation period is the time between the virus caught and the beginning of the symptoms.

Most of the studies estimate that incubation period range from 1 to 14 days. During this time, you can transmit the disease to others.

remember:

how to prevent transmission

Do not touch your eyes, nose or mouth with your hands

Use facial mask and wash your hands

Avoid crowded areas

Keep a safety distance from others

Do not share objects with others

Keep away from sick people
